Historically, cameras have improved to capture higher resolution images than before and this is now becoming a trend in consumer photography as well. In conjunction with this, Adobe has always been talking about continuous efforts to improve Lightroom and fix hardware-compatibility issues. Adobe uses Photoshop and Lightroom for pre-press color management and packaging too. So, we know how important it is for a photo editing app to be scalable and universal in nature. It shouldn't matter whether you use a Mac, PC or mobile device. And without doubt, Lightroom can and should support all of these devices. Lightroom 5 doesn't aim to make complex changes to your images. It replaces blanks and transparencies with the image's pixels, generally in real time. It turns the image into a lightbox, so you can do all kinds of work and see the effect right away. In the old days, it was a darkroom metaphor, but with Lightroom 5, you've got access to the many-leaved current of Lightroom's history too. At the same time it's Photographic Memory Layer (PML) at work when your images are editing in real time, without you having to press a button for every adjustment you wish to make. No matter if you work on a PC, Mac or mobile device. As you may expect, Lightroom 5 hasn't lost any features, instead it has introduced new editing components that will ensure you've got the most precise picture editing tool. It has an improved browser. Now you don't have to open every image and click on them to check their editing status. You can simply right-click the file to see all the opened images and also their editing status in a single location. You can now also see a list of things in any photo. Click on a filter and it will turn up a list of those parameters. You can check whether your image is ready to be published on social media, for example.
